Abstract

The invention relates to an An electronic key (10) whose includes a key housing (11) that has a suspension eyelet (30) in a region close to the near its periphery, with the suspension eyelet (30) having a deployed use position and a stowed non-use position. In order to increase structural freedom of movement when designing the suspension eyelet (30), the The suspension eyelet (30) is held by a guide arm (lever arm 32) which is mounted such that it can move and by means of which movable such that the suspension eyelet (30) is lowered into a receiving space (receiving shaft 15) in the key housing (11) so that where it is inaccessible in its non-use position. [[, and]] It can also be moved out into the use position for the purpose of suspending the electronic key-(10).
